

MycroDrip

The Concept

We have been working in the mushroom industry for almost 40 years.

We manufacture nutrient products (supplements) for mushroom growers to improve dry matter, shelf life, reduce disease and boost yield. We have developed a novel approach to mycelium feeding based on many years of research which is independent of the compost called **MycroNutrient™**.

This product version is called **MycroDrip** and is suitable for application through watering trees, overhead and drip irrigation.

Features

- Easy to use, just watered onto the crop at numerous stages; case run, pinning, in between flushes.
- Unique product for the casing and during the crop.
- It stimulates production getting the maximum potential from phase 2 or 3 compost.
- Used on its own or with existing supplement.

Advantages

- Stimulates increased yield on 2nd/3rd flush.
- Higher % Class A mushrooms.
- Quality of mushrooms is better; more solid and whiter especially 2nd/3rd flush.
- Improved shelf life of mushrooms; higher dry matter content in all flushes.
- Healthier mushrooms and delayed onset of casing diseases especially Cobweb and Verticillium.
- Strong 3rd flush.
- Speeds up crop timing on tight cycles.
- Easy to use; made up and applied on the farm.
- No heating.
- Higher piece weight of mushrooms contributes to lower picking costs.
- Stronger mycelial growth in the casing.
- Easy control of mycelial during recovery period.

MycroDrip in the casing can work on its own but works especially well when **Natural Gold** or other protein supplement is also in the compost.

MycroDrip is the perfect complement to your mushroom crop
