

MycroGranule

The Concept

Protein has been used in mushroom supplementation for over 60 years and we know it is important to the mushroom crop. There are some limitations in its use as it works only in the compost zone and has maximum utilisation during spawn and case run phases with higher temperatures driving enzyme activity of the mycelium. This activity slows down post airing so it can be more challenging to extract the maximum potential from what we add. Adding protein in the casing on its own does not work.

However, through much research work we have found an effective way of adding small doses of specialised protein complexes which work in synergy with our fatty acid liquid products which now make it possible to feed the mushroom much more efficiently during the crop.

Features

- Unique product that is watered on as a feed during the crop
- Easy to apply via watering system when mixed with **MycroNutrient**
- Suitable for all Agaricus White strains
- Maximises potential from compost so adding to **#sustainability**

Advantages

- Heavier dense mushrooms throughout the flush
- Higher dry matter content in mushrooms so better shelf life
- Little / No heating

We recommend that growers use normal compost supplement at existing rates as **MycroGranule** with **MycroNutrient** boost what is already there.

Test reports available on request.
